1 Getting Started

Introduction

The [WePay](#) iOS SDK enables collection of payments via various payment methods(described below).

It is meant for consumption by [WePay](#) partners who are developing their own iOS apps aimed at merchants and/or consumers.

Regardless of the payment method used, the SDK will ultimately return a Payment Token, which must be redeemed via a server-to-server [API](#) call to complete the transaction.

Payment methods

There are two types of payment methods:

- Consumer payment methods - to be used in apps where consumers directly pay and/or make donations
- Merchant payment methods - to be used in apps where merchants collect payments from their customers

The [WePay](#) iOS SDK supports the following payment methods

- Card Swiper (Merchant) Using a Card Swiper, a merchant can accept in-person payments by swiping a consumer's traditional magnetic strip card.
- Card Dipper (Merchant) Using an Card Dipper, a merchant can accept in-person payments by processing a consumer's EMV-enabled chip card.
- Manual Entry (Consumer/Merchant) The Manual Entry payment method lets consumer and merchant apps accept payments by allowing the user to manually enter card info.

Installation

Note: Card reader functionality is not available in this SDK by default. If you want to use this SDK with [WePay](#) card readers, send an email to mobile@wepay.com.

Using [cocoapods](#) (recommended)

- Add pod "WePay" to your podfile
- Run `pod install`
- Done!

The [SwiftExample](#) app also utilizes [cocoapods](#).

Using library binaries

- Download the latest zip file from our [releases page](#)
- Unzip the file and copy the contents anywhere inside your project directory
- In Xcode, go to your app's target settings. On the Build Phases tab, expand the Link Binary With Libraries section.
- Include the following iOS frameworks:
 - AudioToolbox.framework
 - AVFoundation.framework
 - CoreBluetooth.framework
 - CoreLocation.framework
 - CoreTelephony.framework
 - MediaPlayer.framework
 - SystemConfiguration.framework
 - UIKit.framework
 - libstdc++.6.0.9.dylib
- Also include the framework files you copied:
 - TrustDefenderMobile.framework
 - WePay.framework
- Done!

Documentation

HTML documentation is hosted on our [Github Pages Site](#).

Pdf documentation is available on the [releases page](#) or as a direct [download](#).

SDK Organization

[WePay.h](#)

[WePay.h](#) is the starting point for consuming the SDK, and contains the primary class you will interact with. It exposes all the methods you can call to accept payments via the supported payment methods. Detailed reference documentation is available on the reference page for the [WePay](#) class.

Delegate protocols

The SDK uses delegate protocols to respond to API calls. You must adopt the relevant protocols to receive responses to the API calls you make. Detailed reference documentation is available on the reference page for each protocol:

- [WPAuthorizationDelegate](#)
- [WPCardReaderDelegate](#)
- [WPCheckoutDelegate](#)
- [WPTokenizationDelegate](#)

Data Models

All other classes in the SDK are data models that are used to exchange data between your app and the SDK. Detailed reference documentation is available on the reference page for each class.

Next Steps

Head over to the [documentation](#) to see all the API methods available. When you are ready, look at the samples below to learn how to interact with the SDK.

Error Handling

[WPError.h](#) serves as documentation for all errors surfaced by the [WePay](#) iOS SDK.

Samples

See the [WePayExample app](#) for a working implementation of all API methods.

See the [SwiftExample app](#) for a working implementation of all API methods in a Swift 2 application. Note: make sure to open the project using `SwiftApp.xcworkspace` and not `SwiftApp.xcodeproj`.

Initializing a Bridging Header (for Swift apps)

- For using Objective-C modules in a Swift application, you will need to create a bridging header.
- Make sure you are working in `{app_name}.xcworkspace` file.
- Under your target application folder, create a header file: `{app_name}-Bridging-Header.h`
- In the Header file, import the modules you need:

```
#import <WePay/WePay.h>
```

- Click on the main application project to get to `Build Settings`.
- Search for `bridging header` in your target application to find a setting called `Swift Compiler - Code Generation`.
- Double click in the column next to `Objective-C Bridging Header` and add your Header file: `{app_name}/{app_name}-Bridging-Header.h`
- There's no need to import the module in your code; you can use the module by calling it directly in your Swift application.

Initializing the SDK

- Complete the installation steps (above).
- Include [WePay.h](#)

```
#import <WePay/WePay.h>
```

- Define a property to store the [WePay](#) object

```
@property (nonatomic, strong) WePay *wepay;
```

- Create a [WPConfig](#) object

```
WPConfig *config = [[WPConfig alloc] initWithClientId:@"your_client_id" environment:
    kWPEnvironmentStage];
```

- Initialize the [WePay](#) object and assign it to the property

```
self.wepay = [[WePay alloc] initWithConfig:config];
```

(optional) Providing permission to use location services for fraud detection

- In Xcode, go to your projects settings. On the Build Phases tab, expand the Link Binary With Libraries section and include the CoreLocation.framework iOS framework.
- Open your app's Info.plist file and add entries for `NSLocationUsageDescription` and `NSLocationWhenInUseUsageDescription`.

```
1 <key>NSLocationUsageDescription</key>
2 <string>Location information is used for fraud prevention</string>
3 <key>NSLocationWhenInUseUsageDescription</key>
4 <string>Location information is used for fraud prevention</string>
```

- Set the option on the config object, before initializing the [WePay](#) object

```
config.useLocation = YES;
```

Integrating the Swipe payment method

- Adopt the [WPCardReaderDelegate](#) and [WPTokenizationDelegate](#) protocols

```
@interface MyWePayDelegate : NSObject <WPCardReaderDelegate,
    WPTokenizationDelegate>
```

- Implement the [WPCardReaderDelegate](#) protocol methods

```
- (void) cardReaderDidChangeStatus:(id) status
{
    if (status == kWPCardReaderStatusNotConnected) {
        // show UI that prompts the user to connect the Card Reader
        self.statusLabel.text = @"Connect Card Reader";
    } else if (status == kWPCardReaderStatusWaitingForSwipe) {
        // show UI that prompts the user to swipe
        self.statusLabel.text = @"Swipe Card";
    } else if (status == kWPCardReaderStatusSwipeDetected) {
        // provide feedback to the user that a swipe was detected
        self.statusLabel.text = @"Swipe Detected...";
    } else if (status == kWPCardReaderStatusTokenizing) {
        // provide feedback to the user that the card info is being tokenized/verified
        self.statusLabel.text = @"Tokenizing...";
    }
}
```

```

    } else if (status == kWPCardReaderStatusStopped) {
        // provide feedback to the user that the swiper has stopped
        self.statusLabel.text = @"Card Reader Stopped";
    } else {
        // handle any other status messages
        self.statusLabel.text = [status description];
    }
}

- (void) didReadPaymentInfo:(WPPaymentInfo *)paymentInfo
{
    // use the payment info (for display/recordkeeping)
    // wait for tokenization response
}

- (void) didFailToReadPaymentInfoWithError:(NSError *)error
{
    // Handle the error
}

- (void) shouldResetCardReaderWithCompletion:(void (^)(BOOL))completion
{
    // Change this to YES if you want to reset the card reader
    completion(NO);
}

```

- Implement the [WPTokenizationDelegate](#) protocol methods

```

- (void) paymentInfo:(WPPaymentInfo *)paymentInfo didTokenize:(
    WPPaymentToken *)paymentToken
{
    // Send the tokenId (paymentToken.tokenId) to your server
    // Your server would use the tokenId to make a /checkout/create call to complete the transaction
}

- (void) paymentInfo:(WPPaymentInfo *)paymentInfo didFailTokenization:(NSError *)error
{
    // Handle the error
}

```

- Make the [WePay](#) API call, passing in the instance(s) of the class(es) that implemented the delegate protocols

```

[self.wepay startCardReaderForTokenizingWithCardReaderDelegate:self tokenizationDelegate:self
    authorizationDelegate:nil];
// Show UI asking the user to insert the card reader and wait for it to be ready

```

- That's it! The following sequence of events will occur:

1. The user inserts the card reader (or it is already inserted)
2. The SDK tries to detect the card reader and initialize it.
 - If the card reader is not detected, the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusNotConnected`
 - If the card reader is successfully detected, then the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusConnected`.
 - Next, if the card reader is successfully initialized, then the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusWaitingForSwipe`
 - Otherwise, `didFailToReadPaymentInfoWithError:` will be called with the appropriate error, and processing will stop (the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusStopped`)
3. If the card reader successfully initialized, it will wait for the user to swipe a card
4. If a recoverable error occurs during swiping, the `didFailToReadPaymentInfoWithError:` method will be called. After a few seconds, the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusWaitingForSwipe` and the card reader will again wait for the user to swipe a card

5. If an unrecoverable error occurs during swiping, or the user does not swipe, the `didFailToReadPaymentInfoWithError:` method will be called, and processing will stop
6. Otherwise, the user swiped successfully, and the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusSwipeDetected` followed by the `didReadPaymentInfo:` method
7. Next, the SDK will automatically send the obtained card info to [WePay](#)'s servers for tokenization (the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusTokenizing`)
8. If the tokenization succeeds, the `paymentInfo:didTokenize:` method will be called
9. Otherwise, if the tokenization fails, the `paymentInfo:didFailTokenization:` method will be called with the appropriate error

Integrating the Dip payment method

- Adopt the [WPAuthorizationDelegate](#), [WPCardReaderDelegate](#) and [WPTokenizationDelegate](#) protocols

```
\@interface MyWePayDelegate : NSObject <WPAuthorizationDelegate,
    WPCardReaderDelegate, WPTokenizationDelegate>
```

- Implement the [WPCardReaderDelegate](#) and [WPTokenizationDelegate](#) protocol methods (as shown above)
- Implement the [WPAuthorizationDelegate](#) protocol methods

```
- (void) authorizeAmountWithCompletion:(void (^)(double amount, NSString *currencyCode, long accountId))
    completion
{
    // obtain transaction info
    double amount = 10.00;
    NSString *currencyCode = @"USD";
    long accountId = 12345678;

    // execute the completion
    completion(amount, currencyCode, accountId);
}

- (void) selectEMVApplication:(NSArray *)applications
    completion:(void (^)(NSInteger selectedIndex))completion
{
    // In production apps, the payer must choose the app id they want to use.
    // Here, we always select the first application in the array
    int selectedIndex = 0;
    completion(selectedIndex);
}

- (void) insertPayerEmailWithCompletion:(void (^)(NSString *email))completion
{
    // obtain email
    NSString *email = @"emv@example.com";

    // execute the completion
    completion(email);
}

- (void) paymentInfo:(WPPaymentInfo *)paymentInfo
    didAuthorize:(WPAuthorizationInfo *)authorizationInfo
{
    // Send the token Id (authorizationInfo.tokenId) and transaction token
    // (authorizationInfo.transactionToken) to your server
    // Your server must use the tokenId and transactionToken to make a /checkout/create call to complete
    // the transaction
}

- (void) paymentInfo:(WPPaymentInfo *)paymentInfo
    didFailAuthorization:(NSError *)error
{
    // Handle the error
}
```

- Make the [WePay](#) API call, passing in the instance(s) of the class(es) that implemented the delegate protocols

```
[self.wepay startCardReaderForTokenizingWithCardReaderDelegate:self tokenizationDelegate:self
    authorizationDelegate:self];
// Show UI asking the user to insert the card reader and wait for it to be ready
```

- That's it! The following sequence of events will occur:

1. The user inserts the card reader (or it is already inserted)
2. The SDK tries to detect the card reader and initialize it.
 - If the card reader is not detected, the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusNotConnected`
 - If the card reader is successfully detected, then the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusConnected`.
3. Next, the SDK checks if the card reader is correctly configured (the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusCheckingReader`).
 - If the card reader is already configured, the App is given a chance to force configuration. The SDK calls the `shouldResetCardReaderWithCompletion:` method, and the app must execute the completion method, telling the SDK whether or not the reader should be reset.
 - If the reader was not configured, or the app requested a reset, the card reader is configured (the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusConfiguringReader`)
4. Next, if the card reader is successfully initialized, the SDK asks the app for transaction information by calling the `authorizeAmountWithCompletion:` method. The app must execute the completion method, telling the SDK what the amount, currency code and merchant account id is.
5. Next, the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusWaitingForCard`
6. If the user inserts a card successfully, the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusCardDipped`
7. If the card has multiple applications on it, the payer must choose one:
 - The SDK calls the `selectEMVApplication:completion:` method with a list of Applications on the card.
 - The app must display these Applications to the payer and allow them to choose which application they want to use.
 - Once the payer has decided, the app must inform the SDK of the choice by executing the completion method and passing in the index of the chosen application.
8. Next, the SDK extracts card data from the card.
 - If the SDK is unable to obtain data from the card, the `didFailToReadPaymentInfoWithError:` method will be called with the appropriate error, and processing will stop (the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusStopped`)
 - Otherwise, the SDK attempts to ask the App for the payer's email by calling the `insertPayerEmailWithCompletion:` method
9. If the app implements this optional delegate method, it must execute the completion method and pass in the payer's email address.
10. Next, the `didReadPaymentInfo:` method is called with the obtained payment info.
11. Next, the SDK will automatically send the obtained EMV card info to [WePay](#)'s servers for authorization (the `cardReaderDidChangeStatus:` method will be called with `status = kWPCardReaderStatusAuthorizing`)

12. If authorization fails, the `paymentInfo:didFailAuthorization:` method will be called and processing will stop.
13. If authorization succeeds, the `paymentInfo:didAuthorize:` method will be called.
14. Done!

Note: After the card is inserted into the reader, it must not be removed until a successful auth response (or an error) is returned.

Integrating the Manual payment method

- Adopt the [WPTokenizationDelegate](#) protocol

```
\@interface MyWePayDelegate : NSObject <WPTokenizationDelegate>
```

- Implement the [WPTokenizationDelegate](#) protocol methods

```
- (void) paymentInfo:(WPPaymentInfo *)paymentInfo didTokenize:(
    WPPaymentToken *)paymentToken
{
    // Send the tokenId (paymentToken.tokenId) to your server
    // Your server can use the tokenId to make a /checkout/create call to complete the transaction
}

- (void) paymentInfo:(WPPaymentInfo *)paymentInfo didFailTokenization:(NSError *)error
{
    // Handle error
}
```

- Instantiate a [WPPaymentInfo](#) object using the user's credit card and address data

```
WPPaymentInfo *paymentInfo = [[WPPaymentInfo alloc] initWithFirstName:@"WPiOS"
                                                                    lastName:@"Example"
                                                                    email:@"wp.ios.example@wepay.com"
                                                                    billingAddress:[
                                                                    WPAddress alloc] initWithZip:@"94306"]
                                                                    shippingAddress:nil
                                                                    cardNumber:@"5496198584584769"
                                                                    cvv:@"123"
                                                                    expMonth:@"04"
                                                                    expYear:@"2020"
                                                                    virtualTerminal:YES];
// Note: the virtualTerminal parameter above should be set to YES if a merchant is collecting payments
// manually using your app. It should be set to NO if a payer is making a manual payment using your app.
```

- Make the [WePay](#) API call, passing in the instance of the class that implemented the [WPTokenizationDelegate](#) protocol

```
[self.wepay tokenizeManualPaymentInfo:paymentInfo tokenizationDelegate:self];
```

- That's it! The following sequence of events will occur:
 1. The SDK will send the obtained payment info to [WePay](#)'s servers for tokenization
 2. If the tokenization succeeds, the `paymentInfo:didTokenize:` method will be called
 3. Otherwise, if the tokenization fails, the `paymentInfo:didFailTokenization:` method will be called with the appropriate error

Integrating the Store Signature API

- Adopt the [WPCheckoutDelegate](#) protocol

```
\@interface MyWePayDelegate : NSObject <WPCheckoutDelegate>
```

- Implement the [WPCheckoutDelegate](#) protocol methods

```
- (void) didStoreSignature:(NSString *)signatureUrl
    forCheckoutId:(NSString *)checkoutId
{
    // success! nothing to do here
}

- (void) didFailToStoreSignatureImage:(UIImage *)image
    forCheckoutId:(NSString *)checkoutId
    withError:(NSError *)error
{
    // handle the error
}
```

- Obtain the checkout_id associated with this signature from your server

```
NSString *checkoutId = [self obtainCheckoutId];
```

- Instantiate a UIImage containing the user's signature

```
UIImage *signature = [UIImage imageNamed:@"dd_signature.png"];
```

- Make the [WePay](#) API call, passing in the instance of the class that implemented the [WPCheckoutDelegate](#) protocol

```
[self.wepay storeSignatureImage:signature
    forCheckoutId:checkoutId
    checkoutDelegate:self];
```

- That's it! The following sequence of events will occur:

1. The SDK will send the obtained signature to [WePay](#)'s servers
2. If the operation succeeds, the `didStoreSignature:forCheckoutId:` method will be called
3. Otherwise, if the operation fails, the `didFailToStoreSignatureImage:forCheckoutId:withError:` method will be called with the appropriate error

2 Hierarchical Index

2.1 Class Hierarchy

This inheritance list is sorted roughly, but not completely, alphabetically:

<NSObject>

WePay 12

WPAAddress 15

<WPAuthorizationDelegate> 18

<WPCardReaderDelegate>	21
<WPCheckoutDelegate>	23
WPConfig	24
WPPaymentInfo	27
WPPaymentToken	30
WPAuthorizationInfo	19
<WPTokenizationDelegate>	32

3 Class Index

3.1 Class List

Here are the classes, structs, unions and interfaces with brief descriptions:

WePay	12
WPAAddress	15
<WPAuthorizationDelegate>	18
WPAuthorizationInfo	19
<WPCardReaderDelegate>	21
<WPCheckoutDelegate>	23
WPConfig	24
WPPaymentInfo	27
WPPaymentToken	30
<WPTokenizationDelegate>	32

4 File Index

4.1 File List

Here is a list of all documented files with brief descriptions:

WePay.h	??
WPAAddress.h	??

WPAuthorizationInfo.h	??
WPConfig.h	??
WPErrors.h	
WPErrors.h serves as documentation for all errors surfaced by the WePay iOS SDK	33
WPPaymentInfo.h	??
WPPaymentToken.h	??

5 Class Documentation

5.1 WePay Class Reference

```
#import <WePay.h>
```

Inheritance diagram for WePay:

Instance Methods

Initialization

- (instancetype) - [initWithConfig:](#)

Tokenization

- (void) - [tokenizePaymentInfo:tokenizationDelegate:](#)

Card Reader related methods

- (void) - [startCardReaderForReadingWithCardReaderDelegate:](#)
- (void) - [startCardReaderForTokenizingWithCardReaderDelegate:tokenizationDelegate:authorizationDelegate:](#)
- (void) - [stopCardReader](#)

Checkout related methods

Fetches information about the card reader that is currently connected.

- (void) - [storeSignatureImage:forCheckoutId:checkoutDelegate:](#)

Properties

- [WPConfig](#) * *config*

5.1.1 Detailed Description

Main Class containing all public endpoints.

5.1.2 Method Documentation

5.1.2.1 - (instancetype) initWithConfig: (WPConfig *) *config*

The designated initializer. Use this to initialize the SDK.

Parameters

<i>config</i>	A WPConfig instance.
---------------	--------------------------------------

Returns

A [WePay](#) instance, which can be used to access most of the functionality of this sdk.

5.1.2.2 - (void) startCardReaderForReadingWithCardReaderDelegate: (id< WPCardReaderDelegate >) *cardReaderDelegate*

Initializes the card reader for reading card info.

The card reader will wait 60 seconds for a card, and then return a timeout error if a card is not detected. The card reader will automatically stop waiting for card if:

- a timeout occurs
- a card is successfully detected
- an unexpected error occurs
- stopCardReader is called

However, if a general error (domain:kWPErrorCategoryCardReader, errorCode:WPErrorCardReaderGeneralError) occurs while reading, after a few seconds delay, the card reader will automatically start waiting again for another 60 seconds. At that time, [WPCardReaderDelegate](#)'s `cardReaderDidChangeStatus:` method will be called with `kWPReaderStatusWaitingForCard`, and the user can try to use the card reader again. This behavior can be configured with [WPConfig](#).

WARNING: When this method is called, a (normally inaudible) signal is sent to the headphone jack of the phone, where the card reader is expected to be connected. If headphones are connected instead of the card reader, they may emit a very loud audible tone on receiving this signal. This method should only be called when the user intends to use the card reader.

Parameters

<i>cardReaderDelegate</i>	The delegate class which will receive the response(s) for this call.
---------------------------	--

5.1.2.3 - (void) startCardReaderForTokenizingWithCardReaderDelegate: (id< **WPCardReaderDelegate** >) *cardReaderDelegate* tokenizationDelegate:(id< **WPTokenizationDelegate** >) *tokenizationDelegate* authorizationDelegate:(id< **WPAuthorizationDelegate** >) *authorizationDelegate*

Initializes the card reader for reading and then automatically tokenizing card info. If an EMV card is dipped into a connected EMV reader, the card will automatically be authorized.

The card reader will wait 60 seconds for a card, and then return a timeout error if a card is not detected. The card reader will automatically stop waiting for card if:

- a timeout occurs
- a card is successfully detected
- an unexpected error occurs
- stopCardReader is called

However, if a general error (domain:kWPErrorCategoryCardReader, errorCode:WPErrorCardReaderGeneralError) occurs while reading, after a few seconds delay, the card reader will automatically start waiting again for another 60 seconds. At that time, [WPCardReaderDelegate](#)'s cardReaderDidChangeStatus: method will be called with kWPCardReaderStatusWaitingForCard, and the user can try to use the card reader again. This behavior can be configured with [WPConfig](#).

WARNING: When this method is called, a (normally inaudible) signal is sent to the headphone jack of the phone, where the card reader is expected to be connected. If headphones are connected instead of the card reader, they may emit a very loud audible tone on receiving this signal. This method should only be called when the user intends to use the card reader.

Parameters

<i>cardReaderDelegate</i>	The delegate class which will receive the card reader response(s) for this call.
<i>tokenizationDelegate</i>	The delegate class which will receive the tokenization response(s) for this call.
<i>authorizationDelegate</i>	The delegate class which will receive the authorization response(s) for this call.

5.1.2.4 - (void) stopCardReader

Stops the card reader. In response, [WPCardReaderDelegate](#)'s cardReaderDidChangeStatus: method will be called with kWPCardReaderStatusStopped. Any tokenization in progress will not be stopped, and its result will be delivered to the [WPTokenizationDelegate](#).

5.1.2.5 - (void) storeSignatureImage: (UIImage *) *image* forCheckoutId:(NSString *) *checkoutId* checkoutDelegate:(id< **WPCheckoutDelegate** >) *checkoutDelegate*

Stores a signature image associated with a checkout id on [WePay](#)'s servers. The signature can be retrieved via a server-to-server call that fetches the checkout object. The aspect ratio (width:height) of the image must be between 1:4

and 4:1. If needed, the image will internally be scaled to fit inside 256x256 pixels, while maintaining the original aspect ratio.

Parameters

<i>image</i>	The signature image to be stored.
<i>checkoutId</i>	The checkout id associated with this transaction.
<i>checkoutDelegate</i>	The delegate class which will receive the response(s) for this call.

5.1.2.6 - (void) tokenizePaymentInfo: (WPPaymentInfo *) *paymentInfo* tokenizationDelegate:(id< WPTokenizationDelegate >) *tokenizationDelegate*

Creates a payment token from a [WPPaymentInfo](#) object.

Parameters

<i>paymentInfo</i>	The payment info obtained from the user in any form.
<i>tokenizationDelegate</i>	The delegate class which will receive the tokenization response(s) for this call.

5.1.3 Property Documentation

5.1.3.1 - (WPCConfig*) *config* [read], [nonatomic], [strong]

Your [WePay](#) config

The documentation for this class was generated from the following file:

- WePay.h

5.2 WPAAddress Class Reference

```
#import <WPAAddress.h>
```

Inheritance diagram for WPAAddress:

Instance Methods

- (instancetype) - [initWithZip:](#)
- (instancetype) - [initWithAddress1:address2:city:state:zip:](#)
- (instancetype) - [initWithAddress1:address2:city:region:postcode:country:](#)
- (NSDictionary *) - **toDict**

Properties

- NSString * [address1](#)
- NSString * [address2](#)
- NSString * [city](#)
- NSString * [country](#)
- NSString * [postcode](#)
- NSString * [region](#)
- NSString * [state](#)
- NSString * [zip](#)

5.2.1 Detailed Description

An instance of this class represents a physical address.

5.2.2 Method Documentation

5.2.2.1 - (instancetype) initWithAddress1: (NSString *) *address1* address2:(NSString *) *address2* city:(NSString *) *city* region:(NSString *) *region* postcode:(NSString *) *postcode* country:(NSString *) *country*

Initializes a non-US Address.

Parameters

<i>address1</i>	The first line of the street address.
<i>address2</i>	The second line of the street address.
<i>city</i>	The city.
<i>region</i>	The region. Only for non-US addresses when available.
<i>postcode</i>	The postcode. Only for non-US addresses when available.
<i>country</i>	The 2-letters ISO-3166-1 country code.

Returns

The address.

5.2.2.2 - (instancetype) initWithAddress1: (NSString *) *address1* address2:(NSString *) *address2* city:(NSString *) *city* state:(NSString *) *state* zip:(NSString *) *zip*

Initializes a US Address.

Parameters

<i>address1</i>	The first line of the street address.
<i>address2</i>	The second line of the street address.
<i>city</i>	The city.
<i>state</i>	The 2-letters US state code.
<i>zip</i>	The US zip or zip-plus code.

Returns

The address.

5.2.2.3 - (instancetype) initWithZip: (NSString *) zip

Initializes a US Address with just a zip.

Parameters

<i>zip</i>	The US zip or zip-plus code.
------------	------------------------------

Returns

The address.

5.2.3 Property Documentation**5.2.3.1 - (NSString*) address1 [read], [nonatomic], [strong]**

The first line of the street address.

5.2.3.2 - (NSString*) address2 [read], [nonatomic], [strong]

The second line of the street address.

5.2.3.3 - (NSString*) city [read], [nonatomic], [strong]

The city.

5.2.3.4 - (NSString*) country [read], [nonatomic], [strong]

The 2-letters ISO-3166-1 country code.

5.2.3.5 - (NSString*) postcode [read], [nonatomic], [strong]

The postcode. Only for non-US addresses when available.

5.2.3.6 - (NSString*) region [read], [nonatomic], [strong]

The region. Only for non-US addresses when available.

5.2.3.7 - (NSString*) state [read], [nonatomic], [strong]

The 2-letters US state code. Only for US addresses.

5.2.3.8 - (NSString*) zip [read],[nonatomic],[strong]

The US zip or zip-plus code. Only for US addresses.

The documentation for this class was generated from the following file:

- WPAAddress.h

5.3 <WPAuthorizationDelegate> Protocol Reference

```
#import <WePay.h>
```

Inheritance diagram for <WPAuthorizationDelegate>:

Instance Methods

- (void) - [selectEMVApplication:completion:](#)
- (void) - [paymentInfo:didAuthorize:](#)
- (void) - [paymentInfo:didFailAuthorization:](#)

5.3.1 Detailed Description

This delegate protocol has to be adopted by any class that handles EMV authorization responses.

5.3.2 Method Documentation

5.3.2.1 - (void) paymentInfo: (WPPaymentInfo *) paymentInfo didAuthorize:(WPAuthorizationInfo *) authorizationInfo
[required]

Called when an authorization call succeeds.

Parameters

<i>paymentInfo</i>	The payment info for the card that was authorized.
<i>authorizationInfo</i>	The authorization info for the transaction that was authorized.

5.3.2.2 - (void) paymentInfo: (WPPaymentInfo *) *paymentInfo* didFailAuthorization:(NSError *) *error* [required]

Called when an authorization call fails.

Parameters

<i>paymentInfo</i>	The payment info for the card that failed authorization.
<i>error</i>	The error which caused the failure.

5.3.2.3 - (void) selectEMVApplication: (NSArray *) *applications* completion:(void (^)(NSInteger selectedIndex)) *completion* [required]

Called when the EMV card contains more than one application. The applications should be presented to the payer for selection. Once the payer makes a choice, you need to execute the completion block with the index of the selected application. The transaction cannot proceed until the completion block is executed. Example: `completion(0);`

Parameters

<i>applications</i>	The array of NSStrings containing application names from the card.
<i>completion</i>	The block to be executed with the index of the selected application.
<i>selectedIndex</i>	The index of the selected application in the array of applications from the card.

The documentation for this protocol was generated from the following file:

- WePay.h

5.4 WPAuthorizationInfo Class Reference

```
#import <WPAuthorizationInfo.h>
```

Inheritance diagram for WPAuthorizationInfo:

Instance Methods

- (instancetype) - [initWithAmount:currencyCode:transactionToken:tokenId:](#)
- (instancetype) - [initWithId:](#)

Properties

- `NSDecimalNumber *` [amount](#)
- `NSString *` [currencyCode](#)
- `NSString *` [transactionToken](#)
- `NSString *` [tokenId](#)

5.4.1 Detailed Description

A [WPAuthorizationInfo](#) represents authorization information that was obtained from the user's EMV card and is stored on [WePay](#)'s servers. This information can be used to complete the payment transaction via [WePay](#)'s web APIs.

5.4.2 Method Documentation

5.4.2.1 - (instancetype) initWithAmount: (NSDecimalNumber *) *amount* currencyCode:(NSString *) *currencyCode* transactionToken:(NSString *) *transactionToken* tokenId:(NSString *) *tokenId*

Initializes a [WPAuthorizationInfo](#) with the info provided.

Parameters

<i>amount</i>	The amount that was authorized.
<i>currencyCode</i>	The currency code that the amount is specified in.
<i>transactionToken</i>	The transaction token that certifies the transaction
<i>tokenId</i>	The ID of the payment token.

Returns

A [WPAuthorizationInfo](#) object initialized with the info provided.

5.4.2.2 - (instancetype) initWithId: (NSString *) *tokenId*

Initializes a [WPPaymentToken](#) with the Id provided.

Parameters

<i>tokenId</i>	The Id of the token.
----------------	----------------------

Returns

A [WPPaymentToken](#) object initialized with the Id provided.

5.4.3 Property Documentation

5.4.3.1 - (NSDecimalNumber*) amount [read], [nonatomic], [strong]

The amount that was authorized.

5.4.3.2 - (NSString*) currencyCode [read], [nonatomic], [strong]

The currency code that the amount is specified in.

5.4.3.3 - (NSString*) tokenId [read], [nonatomic], [strong], [inherited]

The token's id.

5.4.3.4 - (NSString*) transactionToken [read], [nonatomic], [strong]

The transaction token that certifies the transaction.

The documentation for this class was generated from the following file:

- WPAuthorizationInfo.h

5.5 <WPCardReaderDelegate> Protocol Reference

```
#import <WePay.h>
```

Inheritance diagram for <WPCardReaderDelegate>:

Instance Methods

- (void) - [didReadPaymentInfo:](#)
- (void) - [didFailToReadPaymentInfoWithError:](#)
- (void) - [cardReaderDidChangeStatus:](#)
- (void) - [shouldResetCardReaderWithCompletion:](#)
- (void) - [authorizeAmountWithCompletion:](#)

5.5.1 Detailed Description

This delegate protocol has to be adopted by any class that handles Card Reader responses.

5.5.2 Method Documentation

5.5.2.1 - (void) authorizeAmountWithCompletion: (void(^)(NSDecimalNumber *amount, NSString *currencyCode, long accountId))
completion [optional]

Called when an EMV reader is connected, so that you can provide the amount, currency code and the [WePay](#) account Id of the merchant. The transaction cannot proceed until the completion block is executed. Note: In the staging environment, use amounts of 20.61, 120.61, 23.61 and 123.61 to simulate authorization errors. Amounts of 21.61, 121.61, 22.61, 122.61, 24.61, 124.61, 25.61, and 125.61 will simulate successful auth. Example: completion([NSNumber numberWithInt:21.61], kWPCurrencyCodeUSD, 1234567);

Parameters

<i>completion</i>	The block to be executed with the amount, currency code and merchant account Id for the transaction.
<i>amount</i>	The amount for the transaction. For USD amounts, there can be a maximum of two places after the decimal point. (amount.decimalValue._exponent must be ≥ -2)
<i>currencyCode</i>	The 3-character ISO 4217 currency code. The only supported currency code is kWPCurrencyCodeUSD.
<i>accountId</i>	The WePay account id of the merchant.

5.5.2.2 - (void) cardReaderDidChangeStatus: (id) status [optional]

Called when the card reader changes status.

Parameters

<i>status</i>	Current status of the card reader, one of: kWPCardReaderStatusNotConnected; kWPCardReaderStatusConnected; kWPCardReaderStatusCheckingReader; kWPCardReaderStatusConfiguringReader; kWPCardReaderStatusWaitingForCard; kWPCardReaderStatusShouldNotSwipeEMVCard; kWPCardReaderStatusChipErrorSwipeCard; kWPCardReaderStatusSwipeDetected; kWPCardReaderStatusCardDipped; kWPCardReaderStatusTokenizing; kWPCardReaderStatusAuthorizing; kWPCardReaderStatusStopped;
---------------	--

5.5.2.3 - (void) didFailToReadPaymentInfoWithError: (NSError *) error [required]

Called when an error occurs while reading a card.

Parameters

<i>error</i>	The error which caused the failure.
--------------	-------------------------------------

5.5.2.4 - (void) didReadPaymentInfo: (WPPaymentInfo *) paymentInfo [required]

Called when payment info is successfully obtained from a card.

Parameters

<i>paymentInfo</i>	The payment info.
--------------------	-------------------

5.5.2.5 - (void) shouldResetCardReaderWithCompletion: (void (^)(BOOL shouldReset)) completion [optional]

Optionally called when the connected card reader is already configured, to give the app an opportunity to reset the device. If this method is implemented, the transaction cannot proceed until the completion block is executed. The card reader must be reset here if the merchant manually resets the reader via the hardware reset button on the reader. Examples: completion(YES); completion(NO);

Parameters

<i>completion</i>	The block to be executed with the answer to the question: "Should the card reader be reset?".
<i>shouldReset</i>	The answer to the question: "Should the card reader be reset?".

The documentation for this protocol was generated from the following file:

- WePay.h

5.6 <WPCheckoutDelegate> Protocol Reference

```
#import <WePay.h>
```

Inheritance diagram for <WPCheckoutDelegate>:

Instance Methods

- (void) - [didStoreSignature:forCheckoutId:](#)
- (void) - [didFailToStoreSignatureImage:forCheckoutId:withError:](#)

5.6.1 Detailed Description

This delegate protocol has to be adopted by any class that handles Checkout responses.

5.6.2 Method Documentation

5.6.2.1 - (void) didFailToStoreSignatureImage: (UIImage *) image forCheckoutId:(NSString *) checkoutId withError:(NSError *) error

Called when an error occurs while storing a signature.

Parameters

<i>image</i>	The signature image to be stored.
<i>checkoutId</i>	The checkout id associated with the signature.
<i>error</i>	The error which caused the failure.

5.6.2.2 - (void) didStoreSignature: (NSString *) *signatureUrl* forCheckoutId:(NSString *) *checkoutId*

Called when a signature is successfully stored for the given checkout id.

Parameters

<i>signatureUrl</i>	The url for the signature image.
<i>checkoutId</i>	The checkout id associated with the signature.

The documentation for this protocol was generated from the following file:

- WePay.h

5.7 WPCongig Class Reference

```
#import <WPCongig.h>
```

Inheritance diagram for WPCongig:

Instance Methods

- (instancetype) - [initWithClientId:environment:](#)
- (instancetype) - [initWithClientId:environment:useLocation:useTestEMVCards:callDelegateMethodsOnMainThread:restartCardReaderAfterSuccess:restartCardReaderAfterGeneralError:restartCardReaderAfterOtherErrors:](#)

Properties

- NSString * [clientId](#)
- NSString * [environment](#)
- BOOL [useLocation](#)
- BOOL [useTestEMVCards](#)
- BOOL [callDelegateMethodsOnMainThread](#)
- BOOL [restartCardReaderAfterSuccess](#)
- BOOL [restartCardReaderAfterGeneralError](#)
- BOOL [restartCardReaderAfterOtherErrors](#)

5.7.1 Detailed Description

The configuration object used for initializing a [WePay](#) instance.

5.7.2 Method Documentation

5.7.2.1 - (instancetype) initWithClientId: (NSString *) *clientId* environment:(NSString *) *environment*

A convenience initializer

Parameters

<i>clientId</i>	Your WePay clientId.
<i>environment</i>	The environment to be used, one of (kWPEEnvironmentStage, kWPEEnvironmentProduction).

Returns

A [WPConfig](#) instance which can be used to initialize a [WePay](#) instance.

5.7.2.2 - (instancetype) initWithClientId: (NSString *) *clientId* environment:(NSString *) *environment* useLocation:(BOOL) *useLocation* useTestEMVCards:(BOOL) *useTestEMVCards* callDelegateMethodsOnMainThread:(BOOL) *callDelegateMethodsOnMainThread* restartCardReaderAfterSuccess:(BOOL) *restartCardReaderAfterSuccess* restartCardReaderAfterGeneralError:(BOOL) *restartCardReaderAfterGeneralError* restartCardReaderAfterOtherErrors:(BOOL) *restartCardReaderAfterOtherErrors*

The designated initializer

Parameters

<i>clientId</i>	Your WePay clientId.
<i>environment</i>	The environment to be used, one of (kWPEEnvironmentStage, kWPEEnvironmentProduction).
<i>useLocation</i>	Flag to determine if we should use location services.
<i>useTestEMVCards</i>	Flag to determine if we should use test EMV cards.
<i>callDelegateMethodsOnMainThread</i>	Flag to determine if delegate methods should be called on the main(UI) thread.
<i>restartCardReaderAfterSuccess</i>	Flag to determine if the card reader should automatically restart after a successful read.
<i>restartCardReaderAfterGeneralError</i>	Flag to determine if the card reader should automatically restart after a general error (domain:WPErrorCategoryCardReader, errorCode:WPErrorCardReaderGeneralError).
<i>restartCardReaderAfterOtherErrors</i>	Flag to determine if the card reader should automatically restart after an error other than general error.

Returns

A [WPConfig](#) instance which can be used to initialize a [WePay](#) instance.

5.7.3 Property Documentation

5.7.3.1 - (BOOL) *callDelegateMethodsOnMainThread* [read],[write],[nonatomic],[assign]

Determines if delegate methods should be called on the main(UI) thread. If set to NO, delegate methods will be called on a new background thread. Defaults to YES.

5.7.3.2 `-(NSString*) clientId` `[read], [nonatomic], [strong]`

Your [WePay](#) clientId for the specified environment

5.7.3.3 `-(NSString*) environment` `[read], [nonatomic], [strong]`

The environment to be used, one of (staging, production)

5.7.3.4 `-(BOOL) restartCardReaderAfterGeneralError` `[read], [write], [nonatomic], [assign]`

Determines if the card reader should automatically restart after a swipe/dip general error (domain:kWPErrCategory←CardReader, errorCode:WPErrCardReaderGeneralError). Defaults to YES.

5.7.3.5 `-(BOOL) restartCardReaderAfterOtherErrors` `[read], [write], [nonatomic], [assign]`

Determines if the card reader should automatically restart after a swipe/dip error other than general error. Defaults to NO.

5.7.3.6 `-(BOOL) restartCardReaderAfterSuccess` `[read], [write], [nonatomic], [assign]`

Determines if the card reader should automatically restart after a successful swipe. The card reader is not restarted after a successful dip. Defaults to NO.

5.7.3.7 `-(BOOL) useLocation` `[read], [write], [nonatomic], [assign]`

Determines if we should use location services. Defaults to NO.

5.7.3.8 `-(BOOL) useTestEMVCards` `[read], [write], [nonatomic], [assign]`

Determines if the card reader should accept test EMV cards. Defaults to NO. This should never be turned on in production.

The documentation for this class was generated from the following file:

- WPConfig.h

5.8 WPPaymentInfo Class Reference

```
#import <WPPaymentInfo.h>
```

Inheritance diagram for WPPaymentInfo:

Instance Methods

- (instancetype) - **initWithSwipedInfo:**
- (instancetype) - **initWithEMVInfo:**
- (instancetype) - **initWithFirstName:lastName:email:billingAddress:shippingAddress:cardNumber:cvv:expMonth:expYear:virtualTerminal:**
- (void) - **addEmail:**

Properties

- NSString * **firstName**
- NSString * **lastName**
- NSString * **email**
- NSString * **paymentDescription**
- BOOL **isVirtualTerminal**
- WPAAddress * **billingAddress**
- WPAAddress * **shippingAddress**
- id **paymentMethod**
- id **swiperInfo**
- id **manualInfo**
- id **emvInfo**

5.8.1 Detailed Description

An instance of this class represents the payment information obtained from the user via any of the supported payment methods. It is used as input for tokenization operations.

5.8.2 Method Documentation

5.8.2.1 - (void) addEmail: (NSString *) email

Allows adding an email if one is not already present. The call will be ignored if an email is already present.

Parameters

<i>email</i>	the email address to be added
--------------	-------------------------------

5.8.2.2 - (instancetype) initWithFirstName: (NSString *) firstName lastName:(NSString *) lastName email:(NSString *) email billingAddress:(WPAAddress *) billingAddress shippingAddress:(WPAAddress *) shippingAddress cardNumber:(NSString *) cardNumber cvv:(NSString *) cvv expMonth:(NSString *) expMonth expYear:(NSString *) expYear virtualTerminal:(BOOL) virtualTerminal

Initializes a **WPPaymentInfo** instance of type **kWPPaymentMethodManual**.

Parameters

<i>firstName</i>	First name of the payer.
<i>lastName</i>	Last name of the payer.
<i>email</i>	Email address of the payer.
<i>billingAddress</i>	Billing address.
<i>shippingAddress</i>	Shipping address.
<i>cardNumber</i>	The card number.
<i>cvv</i>	The cvv code.
<i>expMonth</i>	The 2-digit expiration month on the credit card.
<i>expYear</i>	The 4-digit expiration year on the credit card.
<i>virtualTerminal</i>	The virtual terminal flag - should be false if payment info was collected on the payer's device.

Returns

A [WPPaymentInfo](#) object initialized with manually obtained card info.

5.8.3 Property Documentation

5.8.3.1 `-(WPAAddress*) billingAddress` [read], [nonatomic], [strong]

Billing address.

5.8.3.2 `-(NSString*) email` [read], [nonatomic], [strong]

Email address of the payer.

5.8.3.3 `-(id) emvInfo` [read], [nonatomic], [strong]

Additional info obtained by using the EMV payment method.

5.8.3.4 `-(NSString*) firstName` [read], [nonatomic], [strong]

First name of the payer.

5.8.3.5 `-(BOOL) isVirtualTerminal` [read], [nonatomic], [assign]

Determines if the card was obtained in virtual terminal mode.

5.8.3.6 `-(NSString*) lastName` [read], [nonatomic], [strong]

Last name of the payer.

5.8.3.7 `-(id) manualInfo` [read], [nonatomic], [strong]

Additional info obtained by using the Manual payment method.

5.8.3.8 - (NSString*) paymentDescription [read],[nonatomic],[strong]

Masked representation of the payment instrument. e.g. XXXXXXXXXXXX1234 Note: the display format may change depending on the payment instrument and the payment method, so this field should not be parsed. It is meant for display to the end user as-is.

5.8.3.9 - (id) paymentMethod [read],[nonatomic],[strong]

The payment method used, one of (kWPPaymentMethodManual, kWPPaymentMethodSwipe, kWPPaymentMethod← Dip).

5.8.3.10 - (WPAAddress*) shippingAddress [read],[nonatomic],[strong]

Shipping address.

5.8.3.11 - (id) swiperInfo [read],[nonatomic],[strong]

Additional info obtained by using the Swipe payment method.

The documentation for this class was generated from the following file:

- WPPaymentInfo.h

5.9 WPPaymentToken Class Reference

```
#import <WPPaymentToken.h>
```

Inheritance diagram for WPPaymentToken:

Instance Methods

- (instancetype) - initWithId:

Properties

- NSString * tokenId

5.9.1 Detailed Description

A [WPPaymentToken](#) represents payment information that was obtained from the user and is stored on [WePay](#)'s servers. This token can be used to complete the payment transaction via [WePay](#)'s web APIs.

5.9.2 Method Documentation

5.9.2.1 `-(instancetype) initWithId: (NSString *) tokenId`

Initializes a [WPPaymentToken](#) with the Id provided.

Parameters

<i>token</i> ↔	The Id of the token.
<i>Id</i>	

Returns

A [WPPaymentToken](#) object initialized with the Id provided.

5.9.3 Property Documentation**5.9.3.1** `-(NSString*) tokenId` `[read], [nonatomic], [strong]`

The token's id.

The documentation for this class was generated from the following file:

- WPPaymentToken.h

5.10 <WPTokenizationDelegate> Protocol Reference

```
#import <WePay.h>
```

Inheritance diagram for <WPTokenizationDelegate>:

**Instance Methods**

- (void) - [paymentInfo:didTokenize:](#)
- (void) - [paymentInfo:didFailTokenization:](#)
- (void) - [insertPayerEmailWithCompletion:](#)

5.10.1 Detailed Description

This delegate protocol has to be adopted by any class that handles tokenization responses.

5.10.2 Method Documentation**5.10.2.1** `-(void) insertPayerEmailWithCompletion: (void(^)(NSString *email)) completion` `[optional]`

Optionally called so that an email address can be provided before a transaction is authorized. If this method is implemented, the transaction cannot proceed until the completion block is executed. Examples: `completion("api@wepay.com"); completion(nil);`

Parameters

<i>completion</i>	The block to be executed with the payer's email address.
<i>email</i>	The payer's email address.

5.10.2.2 - (void) paymentInfo: (WPPaymentInfo *) paymentInfo didFailTokenization:(NSError *) error

Called when a tokenization call fails.

Parameters

<i>paymentInfo</i>	The payment info that failed tokenization.
<i>error</i>	The error which caused the failure.

5.10.2.3 - (void) paymentInfo: (WPPaymentInfo *) paymentInfo didTokenize:(WPPaymentToken *) paymentToken

Called when a tokenization call succeeds.

Parameters

<i>paymentInfo</i>	The payment info that was tokenized.
<i>paymentToken</i>	The payment token representing the payment info.

The documentation for this protocol was generated from the following file:

- WePay.h

6 File Documentation

- FOUNDATION_EXPORT NSString *const `kWPErrorCategoryCardReader`
- enum `WPErrorCode` `WPErrorCode`

6.1.1 Detailed Description

[WPErrors.h](#) serves as documentation for all errors surfaced by the [WePay](#) iOS SDK.

When errors occur, the [WePay](#) iOS SDK returns NSError instances to delegate methods. Each error instance has the following components:

- [error code] gives the integer code corresponding with the error
- [error domain] gives the domain that the error belongs to
- [error userInfo] gives a dictionary with some more useful info, which can be accessed with the keys kWPErrorsCategoryKey and NSLocalizedDescriptionKey

The [WePay](#) iOS SDK can return errors in various error domains:

- [WePay](#) server API errors are in the [kWPErrorsAPIDomain](#)
- Errors generated by the SDK itself are in the [kWPErrorsSDKDomain](#)
- System errors generated by iOS are passed through as-is, for example in the NSErrorDomain

See the [WPErrorsCode](#) section for more details about error codes.

6.1.2 Macro Definition Documentation

6.1.2.1 `#define WPAuthInfoNotProvidedErrorMessage NSLocalizedStringFromTable(@"Auth info was not provided.", @"WePay",
@"Auth info was not provided.");`

The localizable user facing message for WPErrorsAuthInfoNotProvided, that can be retrieved by calling [error localizedDescription].

6.1.2.2 `#define WPCardBlockedErrorMessage NSLocalizedStringFromTable(@"This card has been blocked.", @"WePay", @"This
card has been blocked.");`

The localizable user facing message for WPErrorsCardBlocked, that can be retrieved by calling [error localizedDescription].

6.1.2.3 `#define WPCardNotSupportedErrorMessage NSLocalizedStringFromTable(@"This card is not supported.", @"WePay",
@"This card is not supported.");`

The localizable user facing message for WPErrorsCardNotSupported, that can be retrieved by calling [error localizedDescription].

6.1.2.4 `#define WPCardReaderGeneralErrorMessage NSLocalizedStringFromTable(@"Swipe failed due to: (a) uneven swipe speed,
(b) fast swipe, (c) slow swipe, or (d) damaged card.", @"WePay", @"Swipe failed due to: (a) uneven swipe speed, (b) fast
swipe, (c) slow swipe, or (d) damaged card.");`

The localizable user facing message for WPErrorsCardReaderGeneralError, that can be retrieved by calling [error localizedDescription].

```
6.1.2.5 #define WPCardReaderInitializationErrorMessage NSLocalizedStringFromTable(@"Failed to initialize card reader.",
    @"WePay", @"Failed to initialize card reader.");
```

The localizable user facing message for `WPErrCardReaderInitialization`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.6 #define WPCardReaderTimeoutErrorMessage NSLocalizedStringFromTable(@"Card reader timed out.", @"WePay", @"Card
    reader timed out.");
```

The localizable user facing message for `WPErrCardReaderTimeout`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.7 #define WPDeclinedByCardErrorMessage NSLocalizedStringFromTable(@"The transaction was declined by the card.",
    @"WePay", @"The transaction was declined by the card.");
```

The localizable user facing message for `WPErrDeclinedByCard`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.8 #define WPDeclinedByIssuerErrorMessage NSLocalizedStringFromTable(@"The transaction was declined by the issuer
    bank.", @"WePay", @"The transaction was declined by the issuer bank.");
```

The localizable user facing message for `WPErrDeclinedByIssuer`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.9 #define WPIInvalidApplicationIdErrorMessage NSLocalizedStringFromTable(@"Invalid application ID selected.", @"WePay",
    @"Invalid application ID selected.");
```

The localizable user facing message for `WPErrInvalidApplicationId`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.10 #define WPIInvalidAuthInfoErrorMessage NSLocalizedStringFromTable(@"The provided auth info is invalid.", @"WePay",
    @"The provided auth info is invalid.");
```

The localizable user facing message for `WPErrInvalidAuthInfo`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.11 #define WPIInvalidCardDataErrorMessage NSLocalizedStringFromTable(@"Invalid card data.", @"WePay", @"Invalid card
    data.");
```

The localizable user facing message for `WPErrInvalidCardData`, that can be retrieved by calling `[error localizedDescription]`.

```
6.1.2.12 #define WPIIssuerUnreachableErrorMessage NSLocalizedStringFromTable(@"The issuing bank could not be reached.",
    @"WePay", @"The issuing bank could not be reached.");
```

The localizable user facing message for `WPErrIssuerUnreachable`, that can be retrieved by calling `[error localizedDescription]`.

6.1.2.13 `#define WPNameNotFoundErrorMessage NSLocalizedStringFromTable(@"Name not found.", @"WePay", @"Name not found.");`

The localizable user facing message for `WPErrorsNameNotFound`, that can be retrieved by calling `[error localizedDescription]`.

6.1.2.14 `#define WPNoDataReturnedErrorMessage NSLocalizedStringFromTable(@"There was no data returned.", @"WePay", @"There was no data returned.");`

The localizable user facing message for `WPErrorsNoDataReturned`, that can be retrieved by calling `[error localizedDescription]`.

6.1.2.15 `#define WPSignatureInvalidImageErrorMessage NSLocalizedStringFromTable(@"Invalid signature image provided.", @"WePay", @"Invalid signature image provided.");`

The localizable user facing message for `WPErrorsInvalidSignatureImage`, that can be retrieved by calling `[error localizedDescription]`.

6.1.2.16 `#define WPUnexpectedErrorMessage NSLocalizedStringFromTable(@"There was an unexpected error.", @"WePay", @"There was an unexpected error.");`

The localizable user facing message for `WPErrorsUnknown`, that can be retrieved by calling `[error localizedDescription]`.

6.1.3 Enumeration Type Documentation

6.1.3.1 `enum WPErrorsCode`

Error codes for `NSError`s surfaced by the [WePay](#) iOS SDK in the `kWPErrorsSDKDomain`. For a full list of error codes in the `kWPErrorsAPIDomain`, visit <https://www.wepay.com/developer/reference/errors>

Enumerator

`WPErrorsUnknown` -10000 Unknown error.

`WPErrorsNoDataReturned` -10015 No data returned by the API call.

`WPErrorsCardReaderGeneralError` -10016 General error reported by the card reader - usually due to a bad swipe.

`WPErrorsCardReaderInitialization` -10017 Error while initializing the card reader.

`WPErrorsCardReaderTimeout` -10018 Timeout occurred while waiting for card.

`WPErrorsCardReaderStatusError` -10019 Special error reported by card reader - very rare.

`WPErrorsInvalidSignatureImage` -10020 Invalid signature image.

`WPErrorsNameNotFound` -10021 Name not found.

`WPErrorsInvalidCardData` -10022 Invalid card data.

`WPErrorsCardNotSupported` -10023 Card not supported.

`WPErrorsEMVTransactionError` -10024 EMV transaction error.

`WPErrorsInvalidApplicationId` -10025 Invalid application ID.

`WPErrorsDeclinedByCard` -10026 Declined by card.

`WPErrorsCardBlocked` -10027 Card blocked.

`WPErrorsDeclinedByIssuer` -10028 Declined by issuer.

`WPErrorsIssuerUnreachable` -10029 Issuer unreachable.

`WPErrorsInvalidAuthInfo` -10030 Invalid auth info.

`WPErrorsAuthInfoNotProvided` -10031 Auth info not provided.

6.1.4 Variable Documentation

6.1.4.1 FOUNDATION_EXPORT NSString* const kWPErrorAPIDomain

The NSError domain of all errors surfaced by the [WePay](#) iOS SDK that were returned by the [WePay](#) API. For a full list of error codes in the [kWPErrorAPIDomain](#), visit <https://www.wepay.com/developer/reference/errors>

6.1.4.2 FOUNDATION_EXPORT NSString* const kWPErrorCategoryCardReader

The value used in the NSError's userInfo dictionary to return the "card reader" error category.

6.1.4.3 FOUNDATION_EXPORT NSString* const kWPErrorCategoryKey

The key used in the NSError's userInfo dictionary to return the error category.

6.1.4.4 FOUNDATION_EXPORT NSString* const kWPErrorCategoryNone

The value used in the NSError's userInfo dictionary to return the "none" error category.

6.1.4.5 FOUNDATION_EXPORT NSString* const kWPErrorSDKDomain

The NSError domain of all errors returned by the [WePay](#) iOS SDK itself. For a full list of error codes in the [kWPErrorSDKDomain](#), look at [WPErrorCode](#).
